

# Congenital Anomalies of the Kidney and Urinary Tract (CAKUT)

Bruce Schlomer, MD  
Associate Professor  
University of Texas Southwestern  
Bruce.Schlomer@UTSouthwestern.edu

1

## CAKUT - Categories

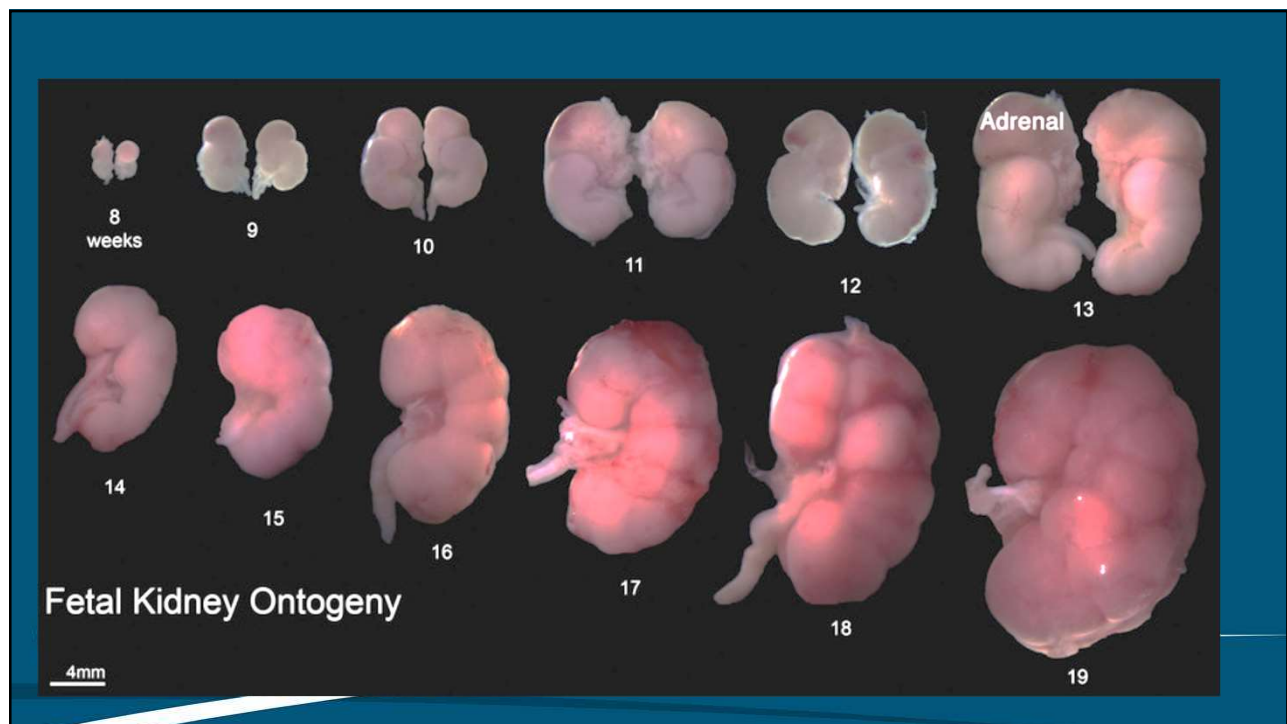

- Renal parenchymal anomalies
  - Renal dysplasia, MCDK, ADPKD, ARPKD, renal agenesis
- Collecting system anomalies
  - Hydronephrosis, UPJ obstruction, megaureter, megacalycosis, ectopic ureter, ureterocele, duplicated kidney, VUR
- Renal ascent and fusion anomalies
  - Ectopic kidney, horseshoe kidney, crossed renal ectopia (fused/unfused)
- Lower urinary tract anomalies
  - Posterior urethral valves, anterior urethral valves, urethral atresia, megalourethra, prune belly syndrome, urachal remnants

2

3

## Embryology Key Points

- 3 kidneys develop from intermediate mesoderm
  - Pronephros -> regresses by week 4, forget about it...
  - Mesonephros (Wolfian duct)-> *caudal end ureteric bud, vas/epididymis/seminal vesical, trigone*
  - Metanephros (starts week 5) = *final kidney!*
    - Intermediate mesoderm in the sacral area
    - Interacts with the ureteric bud to become renal parenchyma
    - While ascending, blood supply changes along great vessels

## Metanephros and ureteric bud

- Ureteric bud comes off mesonephric duct, AKA Wolfian duct
- Ureteric bud branches -> *collecting ducts and everything distal*
- Metanephros becomes everything else
- Urine at 10-11 wks, fully developed by week 32

American  
Urological  
Association  
Education & Research, Inc.

5

## CAKUT - Categories

- Renal parenchymal anomalies
  - Renal dysplasia, MCDK, ADPKD, ARPKD, renal agenesis
- Collecting system anomalies
  - Hydronephrosis, UPJ obstruction, megaureter, megacalycosis, ectopic ureter, ureterocele, duplicated kidney, VUR
- Renal ascent and fusion anomalies
  - Ectopic kidney, horseshoe kidney, crossed renal ectopia (fused/unfused)
- Lower urinary tract anomalies
  - Posterior urethral valves, anterior urethral valves, urethral atresia, prune belly syndrome

American  
Urological  
Association  
Education & Research, Inc.

## Renal parenchymal anomalies

- Abnormal development of metanephros -> abnormal renal parenchyma = *renal dysplasia*
- Ureteric bud and metanephros interact -> *dysplasia often associated collecting system anomalies*
  - VUR, ectopic ureter, ureterocele
- Multicystic Dysplastic Kidney (MCDK)
- Autosomal dominant polycystic kidney disease (ADPKD)
- ARPKD (Autosomal recessive polycystic kidney disease (ARPKD))
- Renal agenesis

American  
Urological  
Association  
Education & Research, Inc.

7

## Multicystic dysplastic kidney

- ~1/1000 births, often prenatal detection
- Severe renal dysplasia, often absent or atretic ureter
- Non-reniform shape, *multiple non-communicating cysts*
- No function on renal scans
- Natural history is involution
  - Observe serial ultrasounds
- *Surgery is rarely indicated*
  - HTN, pulmonary compromise
- *Risk of malignancy is negligible*

American  
Urological  
Association  
Education & Research, Inc.

8

## Autosomal Dominant Polycystic Kidney Disease (ADPKD)

- ~1/500. Mutations in PKD1 (85%) or PKD2 gene
- PKD1 mutations
  - More severe, >90% have cysts by age 20, ESRD in 50s typical
- Can present with simple cysts in childhood
  - Multiple cysts, especially bilateral -> testing for ADPKD
- **Large cysts are typical**
- Progressive cysts, HTN, hematuria, ESRD, stones
- Extra-renal manifestations
  - Liver/spleen/pancreatic cysts, intracranial (berry) aneurysms, mitral valve prolapse

American  
Urological  
Association  
Education & Research, Inc.

9

## Autosomal Dominant Polycystic Kidney Disease (ADPKD)

- Simple cysts in children followed a couple years
  - If more cysts develop -> consider ADPKD
- Rarely surgery needed in childhood for ADPKD
- Treatment goal is to delay ESRD
  - HTN control; ACE inhibitors
- Adulthood
  - Renal transplants, **large kidneys -> native nephrectomy**
- ~20% have aneurysms and ~10% fatal
  - Berry aneurysms of Circle of Willis -> subarachnoid hemorrhage

American  
Urological  
Association  
Education & Research, Inc.

## Autosomal Recessive Polycystic Kidney Disease (ARPKD)

- ~1/20000, prenatal detection. Mutation in PKHD1.
- *Very large, homogeneous, echogenic kidneys*
- *Small cysts (mm) compared to large cysts in ADPKD*
  - Cysts involve collecting tubules
- More lethal than ADPKD:
  - 50% of newborns do not survive
- Less severe cases exist with delayed diagnosis and better survival

## Autosomal Recessive Polycystic Kidney Disease (ARPKD)

- One cause of Potter syndrome
  - Due to lack of amniotic fluid
  - Low set ears, wide set eyes, recessed chin, broad nose, short limbs, *pulmonary compromise*
- Multiple comorbidities and medical issues
  - Hepatic fibrosis/failure, *pulmonary issues*, HTN, resulting CHF, esophageal varices, portal HTN, developmental delays
- Newborns (if survive) often require unilateral/bilateral nephrectomy due to large size of kidneys
  - Pediatric urology consultation

## Renal agenesis

- ~1/4000 births. Theory: failure of ureteral bud formation
- Compensatory hypertrophy of contralateral kidney
- Bilateral renal agenesis usually fatal in-utero or after birth
  - Another cause of potter syndrome
- **Can have ipsilateral absence of vas and epididymis**
  - **Why? Wolfian duct gives rise to ureteral bud and vas/epididymis**
  - **Random fact: bilateral absence of vas seen with cystic fibrosis and CFTR gene mutations (often heterozygous)**

American  
Urological  
Association  
Education & Research, Inc.

13

## Obstructed Hemivagina and Ipsilateral Renal Anomalies (OHVIRA)

- Duplicated uterus/vagina, ipsilateral obstructed
- Mullerian and Wolfian ducts close to each other
  - Something goes wrong -> OHVIRA can occur
- Presentations
  - **Infant: dilated hemivagina/solitary kidney on imaging**
  - **Puberty: cyclic pain with possible vaginal bulge**
- Treatment: incision/excision of vaginal septum
- Nephrectomy if vaginal leakage after incision

American  
Urological  
Association  
Education & Research, Inc.

## CAKUT - Categories

- Renal parenchymal anomalies
  - Renal dysplasia, MCDK, ADPKD, ARPKD, renal agenesis
- **Collecting system anomalies**
  - Hydronephrosis, UPJ obstruction, megaureter, megacalycosis, ectopic ureter, ureterocele, duplicated kidney, VUR
- Renal ascent and fusion anomalies
  - Ectopic kidney, horseshoe kidney, crossed renal ectopia (fused/unfused)
- Lower urinary tract anomalies
  - Posterior urethral valves, anterior urethral valves, urethral atresia, megalourethra, prune belly syndrome, urachal remnants

American  
Urological  
Association  
Education & Research, Inc.

15

## Antenatal Hydronephrosis

- Most common fetal abnormality
  - 1-3% of fetuses
- ***Majority will be mild and transient***
- Unilateral mod/severe hydronephrosis should be observed
  - Surgery was done after birth early on with prenatal US experience -> overtreatment of UPJ obstructions
- Some diagnoses important to not miss!
  - posterior urethral valves, ureterocele, ectopic ureter

American  
Urological  
Association  
Education & Research, Inc.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Hydronephrosis Grading - SFU

- SFU Grade 1- only renal pelvis/ **no caliectasis**
  - “Mild”
- SFU Grade 2- dilated pelvis and **single or few calices**
  - “Mild”
- SFU Grade 3- dilated pelvis and **uniformly dilated** calyces
  - “Moderate”
- SFU Grade 4- grade 3 dilation with **thin parenchyma**
  - “Severe”

17

## Hydronephrosis Grading – UTD Classification

- Introduced in 2014; UTD = urinary tract dilation
- 6 elements
  - Anterior-posterior renal pelvis diameter (APRPD), degree of dilation of calyces, parenchyma thickness, parenchyma appearance, hydroureter, bladder
- Findings = risk score
- Antenatal and postnatal classifications
  - Antenatal: UTD A1 = low risk, UTD A2-3 = increased risk
  - **Postnatal: UTD P1 = low risk, UTD P2 = intermediate, UTD P3 = high**
- Management based on UTD risk score

# Hydronephrosis Grading – UTD Classification

## RISK-BASED MANAGEMENT, PRENATAL DIAGNOSIS

UTD A1: LOW RISK	UTD A2-3: INCREASED RISK
<b>PRENATAL PERIOD:</b> One additional US ≥ 32 weeks	<b>PRENATAL PERIOD:</b> Initially in 4 to 6 weeks*
<b>AFTER BIRTH:</b> Two additional US: 1. > 48 hrs to 1 month 2. 1-6 months later	<b>AFTER BIRTH:</b> US at > 48 hours to 1 month of age*
<b>OTHER:</b> Aneuploidy risk modification if indicated	<b>OTHER:</b> Specialist consultation, e.g. nephrology, urology

\*certain situations (e.g. posterior urethral valves, bilateral severe hydronephrosis) may require more expedient follow up

## RISK-BASED MANAGEMENT, POSTNATAL DIAGNOSIS

UTD P1: LOW RISK	UTD P2: INTERMEDIATE RISK	UTD P3: HIGH RISK
<b>FOLLOW UP US:</b> 1 to 6 months	<b>FOLLOW UP US:</b> 1 to 3 months	<b>FOLLOW UP US:</b> 1 month
<b>VCUG:</b> Discretion of clinician	<b>VCUG:</b> Discretion of clinician	<b>VCUG:</b> Recommended
<b>ANTIBIOTICS:</b> Discretion of clinician	<b>ANTIBIOTICS:</b> Discretion of clinician	<b>ANTIBIOTICS:</b> Recommended
<b>FUNCTIONAL SCAN:</b> Not recommended	<b>FUNCTIONAL SCAN:</b> Discretion of clinician	<b>FUNCTIONAL SCAN:</b> Discretion of clinician

The choice to utilize prophylactic antibiotics or recommend voiding cystourethrogram will depend on the suspected underlying pathology

American  
Urological  
Association  
Education & Research, Inc.

21

## Infants with hydronephrosis key points

- **Initial renal US should be done > 48 hours after birth**
  - Newborns can be dehydrated -> underestimation of hydronephrosis
- Most prenatal hydronephrosis will be unilateral and transient
- **Don't miss PUV, ectopic ureter, ureterocele -> expedite evaluation**
- No randomized controlled trials for antibiotic prophylaxis
  - Observational studies suggest benefit with hydroureter
  - Consider if VCUG planned
- If no calyceal dilation and APRPD < 10 mm = normal
- Even moderate to severe hydronephrosis can improve/resolve

American  
Urological  
Association  
Education & Research, Inc.

22

## Antenatal Hydronephrosis - etiology

**Table 5** The etiology of ANH.

Etiology	Incidence
Transient hydronephrosis	41–88%
UPJ obstruction	10–30%
VUR	10–20%
UVJ obstruction/megaureters	5–10%
Multicystic dysplastic kidney	4–6%
PUV/urethral atresia	1–2%
Ureterocele/ectopic ureter/duplex system	5–7%
Others: prune belly syndrome, cystic kidney disease, congenital ureteric strictures and megalourethra	Uncommon

**Table 4** Risk of specific postnatal pathologic conditions by the degree of ANH.

	% ANH [95% CI]		
	Mild	Moderate	Severe
UPJ	4.9 [2.0–11.9]	17.0 [7.6–33.9]	54.3 [21.7–83.6]
VUR	4.4 [1.5–12.1]	14.0 [7.1–25.9]	8.5 [4.7–15.0]
PUV	0.2 [0.0–1.4]	0.9 [0.2–2.9]	5.3 [1.2–21.0]
Ureteral obstruction	1.2 [0.2–8.0]	9.8 [6.3–14.9]	5.3 [1.4–18.2]
Other	1.2 [0.3–4.0]	3.4 [0.5–19.4]	14.9 [3.6–44.9]

Journal of Pediatric Urology (2010) 6, 212e231

23

## Antenatal Hydronephrosis – Etiology Key Points

- Transient hydronephrosis is most common by far
- Vesicoureteral reflux is a possibility for any severity
- UPJ obstruction is most common obstruction
  - more likely from mild to severe
- PUV, ectopic ureter, ureterocele are rare, but do not miss

American  
Urological  
Association  
Education & Research, Inc.

24

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## UPJ Obstruction - Infants

- Commonly intrinsic narrowing and/or high insertion
- SFU grade 4 -> ~25-50% will get pyeloplasty
- SFU grade 3 -> ~15% or less
- SFU grade 1-2 -> rare
- UTIs, stones, or symptoms are rare

American  
Urological  
Association  
Education & Research, Inc.

25

## UPJ Obstruction – Older children

- More likely to have symptoms
  - Pain/nausea (Dietl's crisis) with fluid intake
  - Pain poorly localized, esp. younger children
  - *Ultrasound at time of pain can be helpful*
- More commonly lower pole crossing vessel
  - Often unknown until surgery
- Fibroepithelial polyp rare
  - Seen on ultrasound as vascular area
- Intrinsic narrowing or high insertion possible

American  
Urological  
Association  
Education & Research, Inc.

26

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## UPJ Obstruction – MAG 3 scan

- Bladder catheter if not toilet trained/Sedation for younger children
- Various protocols for Lasix
  - At 30 minutes, at time of peak activity, at 20 minutes
- Normal findings
  - Time to peak activity: 3-5 minutes
  - Drainage time: T1/2 to clear after peak activity = 8-12 minutes
  - Differential uptake of radiotracer: 45-55%
- Important to look at actual images and the curves
- *Cut-offs of drainage (ex.  $T_{1/2} > 20$  minutes) not used as much in peds*

American  
Urological  
Association  
Education & Research, Inc.

27

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## UPJ obstruction – indications for surgery

- Practices and family preferences vary widely
- In order of strength of indication
  - Symptomatic (pain, UTIs, stones), UTIs rare
  - Declining differential function over time
  - Initial low differential function (<40%) and severe hydronephrosis
  - Worsening hydronephrosis over time with stable function
  - Stable severe hydronephrosis and function with no improvement with observation (2-4 years?)

American  
Urological  
Association  
Education & Research, Inc.

29

## UPJ obstruction - treatment

- Dismembered pyeloplasty
  - Open, laparoscopic, robotic assisted
  - Robotic likely easier recovery for older children
- Risks: urine leak, persistent or recurrent obstruction (~5%)
- Ureteral stent and drain usage vary
- ***If lower pole crossing vessel, anastomosis anterior to vessels***

American  
Urological  
Association  
Education & Research, Inc.

30

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Dismembered Pyeloplasty Key Steps

- Reflect colon or transmesenteric
  - For robotic
- Dissect ureter up to renal pelvis
- Identify any crossing vessels
- Place hitch stitch in renal pelvis
- Open renal pelvis, spatulate
- Anastomosis
- +/- ureteral stent or drain
- Foley catheter in overnight

American  
Urological  
Association  
Education & Research, Inc.

Journal of Endourology. May 2018. S-68-S-72.

31

## UPJ obstruction – special situations

Spiral flap pyeloplasty

- **Long stricture**

- **Failures**

Ureterocalycostomy

- **Failures**

- **Thin parenchyma**

American  
Urological  
Association  
Education & Research, Inc.

32

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Megaureter

- ***Megaureter is just descriptive term***
  - refluxing or non-refluxing
  - obstructed or non-obstructed
  - Ectopic ureter, ureterocele, VUR, primary megaureter (UVJO)
  - High pressure bladder: PUV, neurogenic bladder
- ***What causes a refluxing and obstructed megaureter?***
  - *An ectopic ureter to the bladder neck*

## Primary Megaureter/UVJ obstruction

- ***Natural history is resolution with observation***
  - VCUG normal
  - MAG 3 scan – equal function, delayed drainage but radiotracer in ureter
- ***Typically a distal narrow segment***
- Indications for treatment similar to UPJO
  - Ureteral reimplant most common, possible tapering
  - Ureteral dilation, prolonged ureteral stent, laser incision of distal narrow segment
  - Refluxing reimplant reported

## Vesicoureteral Reflux

- Embryology/theory
  - More distal ureteral bud -> more lateral and cranial UO in bladder
  - More lateral and cranial UO -> shorter intramural tunnel through detrusor
  - Shorter intramural tunnel -> lack of mucosal coaptation
  - Lack of mucosal coaptation -> VUR
- *Typically present with UTIs*
  - Incidental abnormal imaging, HTN, proteinuria less common
- Diagnosed by cystogram (VCUG, etc)
- Secondary reflux = bladder issues (neurogenic, dysfunctional voiding)

American  
Urological  
Association  
Education & Research, Inc.

35

- VCUG
  - Grade 1-5<sup>1</sup>
- Nuclear medicine cystogram
  - mild, moderate, severe
- Contrast enhanced voiding cystourethrogram (CEVUS)
  - Grade 1-5

<sup>1</sup>Pediatrics. 1981 Mar;67(3):392-400.

36

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## VUR: Natural history

- Lower grade more likely to resolve
- Younger children more likely to resolve
- Unilateral VUR is more likely to resolve
- **Initial treatment is typically observation +/- prophylaxis**

J Urol. 1997;157[5]:1846-1851

37

## VUR and UTIs key points

- UTIs are one of the most frequent bacterial infections
- Prevalence of UTI in children 2-24 months with fever without apparent source ~ 5%<sup>1</sup>
- By age 8 yrs: 7-8% girls, 2% boys have a UTI<sup>1</sup>
- **VUR -> increased risk of subsequent UTI<sup>2</sup>**
- ~30-40% of children with febrile UTI have VUR<sup>3</sup>
  - 50-60% grade I-II, ~40% grade III, <5% grade IV or V

1. N Engl J Med. 2011;365:239-50  
 2. Pediatrics 2008;122:1064-1071  
 3. JAMA. 2007;298(2):179-186

38

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## VUR and Renal Scarring Key Points

- 60% with febrile UTI < 24 mo have pyelo on DMSA
  - *initial normal DMSA = no renal scarring*
  - *initial abnormal DMSA = 15-30% risk renal scar*
- ~90% will have a normal renal ultrasound
- *VUR = increased risk of scar at 6 months*
  - *6% no VUR vs. 15% with VUR*

American  
Urological  
Association  
Education & Research, Inc.

N Engl J Med 2003; 348:195-202  
Pediatrics 2008; 122:486-490

39

## VUR and Bowel Bladder Dysfunction

- VUR has strong association with bowel bladder dysfunction (BBD)
  - Holding behaviors, constipation, poor bladder emptying, etc
  - Leads to incontinence, urgency, recurrent UTIs (febrile vs nonfebrile)
  - Females have incontinence/UTIs, boys incontinence less UTIs
- *Important to treat BBD = urotherapy*
  - Timed voiding, double voiding, prevention of constipation, learning to relax sphincter with voiding (biofeedback)
- VUR may resolve with treatment of BBD
- *Failure to treat BBD can lead to treatment failure*
  - *And missing questions on ABU exams*

American  
Urological  
Association  
Education & Research, Inc.

## VUR: Antibiotic Prophylaxis/RIVER Trial

- Intervention: trimethoprim-sulfamethoxazole vs placebo
- Inclusion: 2 mo – 6 years with 1<sup>st</sup> febrile or symptomatic UTI
  - Grade I-IV VUR
- Outcomes
  - Recurrent febrile or symptomatic UTIs
  - Abnormal DMSA (renal scarring)
- 607 patients randomized
  - 10800 screened

American  
Urological  
Association  
Education & Research, Inc.

41

## VUR: Antibiotic Prophylaxis (RIVUR)

- TMP-SMX lowers risk ( $p < 0.001$ , log rank).
  - ~50% risk reduction
  - NNT = 8 for 2 years
- *No difference* in new renal scarring
  - 8.2% vs 8.4%
- Effect modifiers
  - Febrile UTI – more effect
  - BBD – more effect

American  
Urological  
Association  
Education & Research, Inc.

**Figure 2. Time to First Recurrent Febrile or Symptomatic UTI.**

Shown are Kaplan-Meier estimates of the cumulative percentage of children who had a recurrent febrile or symptomatic UTI according to study group. Fewer children assigned to TMP-SMX prophylaxis had a UTI than children assigned to placebo ( $P < 0.001$  by log-rank test). I bars indicate 95% confidence intervals.

## VUR: Surgical Treatment

- **Indications for surgery**
  - Break through UTIs, renal scarring, family preference, high grade VUR that does not resolve
- Open ureteral reimplant is gold standard
  - Cross trigonal most common technique
  - Complications rare: persistent VUR, ureteral obstruction
  - Typically overnight hospital stay
  - **Decreases risk of febrile UTIs, decrease in renal scarring not proven**
- Success in meta-analysis
  - 99% grade I-II, 98.3% grade III, 98.5% grade IV, 80.7% grade V

American  
Urological  
Association  
Education & Research, Inc.

J Urol. 1997 May;157(5):1846-51. PMID: 9112544.

## VUR: Robotic Reimplant

- Extravesical reimplant most common
- Perhaps easier recovery in older children
- Success rates initially lower than open but recent studies suggest similar results to open reimplant
- Some reports of ureteral complications (necrosis, urine leak)
- **Special complication of bilateral extravesical ureteral reimplant**
  - **Urinary retention. Usually transient, rarely permanent.**
  - **Neuropraxia = temporary nerve injury**

American  
Urological  
Association  
Education & Research, Inc.

World J Urol. 2018 May;36(5):819-828.  
J Pediatr Urol. 2018 Jun;14(3):262.e1-262.e6.

45

## VUR: Endoscopic Injection = outpatient

- Hyaluronic Acid/Dextranomer (Deflux®)
- Systematic review with lower success
  - 89% grade I, 83% grade II, 71% grade III, 59% grade IV, 62% grade V
- **Some risk of VUR recurrence over time**
  - **BBD increases risk of recurrence**
- **Can get calcified over years**
  - **Confusion about possible ureteral stone**

American  
Urological  
Association  
Education & Research, Inc.

Kirsch. J Urology 2004  
Lackgren and Kirsch, BJU Intl 2010  
Pediatrics 2010;125:1010

## VUR: AUA Guidelines

AUA  
GUIDELINES

- Initial evaluation of child with known VUR
  - UA and renal US; serum Cr and DMSA optional
- **< 1 year with febrile UTI or Grade III-V: antibiotic prophylaxis**
- > 1 year with BBD: antibiotic prophylaxis and treat BBD
- > 1 year without BBD: antibiotic prophylaxis optional
- Follow up
  - **Renal US and UA annually for all**
  - Repeat VCUG in higher grades of VUR, optional for grade I-II
  - DMSA if renal US is abnormal and suggestive of scarring

American  
Urological  
Association  
Education & Research, Inc.

AUA Guideline: Management and Screening of Primary Vesicoureteral Reflux in Children (2017)

47

## VUR: AUA Guidelines

AUA  
GUIDELINES

- Recurrent or breakthrough UTI = **Change management**
  - Start prophylaxis, change prophylaxis, consider surgery
- Surgery follow up
  - **Renal US after any surgical treatment**
  - Cystogram after endoscopic injection, optional after open reimplant
- Long term follow up
  - If abnormal DMSA, annual blood pressure, weight, UA
- **Screening for VUR in siblings not recommended**
- VCUG for prenatal hydro if SFU grade 3-4 or febrile UTI

American  
Urological  
Association  
Education & Research, Inc.

AUA Guideline: Management and Screening of Primary Vesicoureteral Reflux in Children (2017)

## Duplicated kidney: Weigert-Meyer rule

- 2 ureteric buds -> duplex kidney
- Wolfian ducts fuse caudal to cranial to form trigone
- Caudal ureteric bud incorporated into trigone first and migrates cranial and lateral
- Cranial ureteric bud incorporated last and ends up caudal and medial

American  
Urological  
Association  
Education & Research, Inc.

Campbell's Urology 12<sup>th</sup> Edition

49

## Duplicated kidney

- **Normal variant**
  - 1-5%; Can be partial or complete
- Suggested by parenchymal bar on ultrasound
- Can have VUR or obstruction
  - Lower pole VUR
  - Upper pole (ectopic ureter, ureterocele)
  - Rare lower pole UPJ obstruction
- If no hydro or UTIs, no follow up or VCUG

American  
Urological  
Association  
Education & Research, Inc.

50

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Duplicated Kidney and VUR

- Lower pole is more likely to have VUR
  - Lateral and cranial location
- Characteristic appearance = *“drooping lily”*
- **Initial management similar**
  - *Less likely to resolve spontaneously*
- Surgical treatment
  - Open double barrel ureteral reimplant
  - Endoscopic injection – less successful compared to non-duplicated?
  - Lower to upper pole uretero-ureterostomy – refluxing stump issues?

American  
Urological  
Association  
Education & Research, Inc.

51

## Ectopic Ureter and Ureterocele

- About 1/1000 births – *rare, but do not miss*
- Usually with duplicated kidneys (~80%)
  - Upper pole will be ectopic/ureterocele
- **Continuous incontinence in female = ectopic ureter**
  - *Can insert into mullerian structures, vagina, perineum*
- Males will not have incontinence with ectopic ureter
  - Always inserts proximal to sphincter
- Typically diagnosed on prenatal ultrasound
  - UTI, ureterocele prolapse, incontinence in females

American  
Urological  
Association  
Education & Research, Inc.

52

© 2025 AMERICAN UROLOGICAL ASSOCIATION. ALL RIGHTS RESERVED.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Ureterocele

- Cystic dilation of distal ureter
  - Associated hydronephrosis/hydroureter
  - Lower function in upper pole typical
- Ureteral orifice can be intravesical or ectopic near bladder neck or in urethra
- Prenatal diagnosis
- *Ureterocele prolapse, bladder outlet obstruction can occur*

American  
Urological  
Association  
Education & Research, Inc.

53

## Ureterocele Imaging Findings

- Renal US
  - Duplex kidney
  - Dysplastic parenchyma
  - Upper pole hydronephrosis, can have lower as well
  - Cystic structure in bladder
- VCUG
  - Early filling defect
  - Lower pole VUR
  - Ureterocele eversion
  - Bladder outlet obstruction with ureterocele prolapsing into bladder neck

American  
Urological  
Association  
Education & Research, Inc.

54

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Ureterocele Imaging Findings - spectrum

- Single system
- Less hydronephrosis
- Healthy parenchyma
- Smaller ureterocele

55

## Ureterocele Imaging Findings - spectrum

- Duplex system
- Upper and lower pole hydronephrosis
- No ureterocele prolapse

56

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Ureterocele Management

- Infants used to present with sepsis
  - With prenatal ultrasounds, pre-emptive intervention began
- **Renal US, VCUG soon after birth and antibiotic prophylaxis**
- **Endoscopic incision of ureterocele in infancy is common**
  - Selective observation (small, single system, male, mild hydro)
- Incision -> 50% risk ipsilateral VUR into upper pole ureter
- Ureterocele excision with duplex reimplant may be needed
  - Indications: recurrent UTIs, persistent high grade VUR

American  
Urological  
Association  
Education & Research, Inc.

57

## Post ureterocele incision VUR

Ureterocele  
incision

Upper pole VUR

Not “drooping lily”  
but “hammer”

Duplex  
reimplant

American  
Urological  
Association  
Education & Research, Inc.

## Ureterocele Management Options Summary

Figure 8: Options for Definitive Surgical Management, Ureterocele

	Ideal Indications	Advantages	Limitations
<b>Transurethral incision</b>	-Small infant -Large ureterocele with VUR	-Outpatient procedure* -Effective decompression -Occasionally definitive	-De-novo reflux into ureterocele segment necessitating subsequent lower tract reconstruction
<b>Upper pole nephrectomy</b>	No lower moiety VUR Nonfunctioning upper moiety	-May be definitive -Removes pathology -Avoids bladder surgery	-May still require lower tract reconstruction -Risk to lower moiety
<b>UU/ureteropyelostomy</b>	No lower moiety VUR Functional upper moiety	Drains obstructed segment with little risk for obstruction or UTI	Leaves ureterocele in bladder May develop VUR
<b>Common sheath reimplant with ureterocele excision</b>	Associated lower moiety VUR Functional upper moiety without significant dilation	Eliminates obstruction and VUR Removes ureterocele No renal risk	Complex surgery Risk to vagina and BN May require ureteral tapering

\*unless patient is an infant requiring admission for oxygen monitoring

AUA core curriculum

59

## Ectopic Ureter

- Renal US, VCUG, prophylaxis
- Varying degrees of renal dysplasia
- Imaging findings
  - Duplex kidney (~80%)
  - Hydroureteronephrosis to bladder
  - Upper pole hydro and dysplasia
  - Possible lower pole VUR
  - “Pseudoureterocele” = large dilated ureter pushing into bladder, thick wall

60

© 2025 AMERICAN UROLOGICAL ASSOCIATION. ALL RIGHTS RESERVED.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

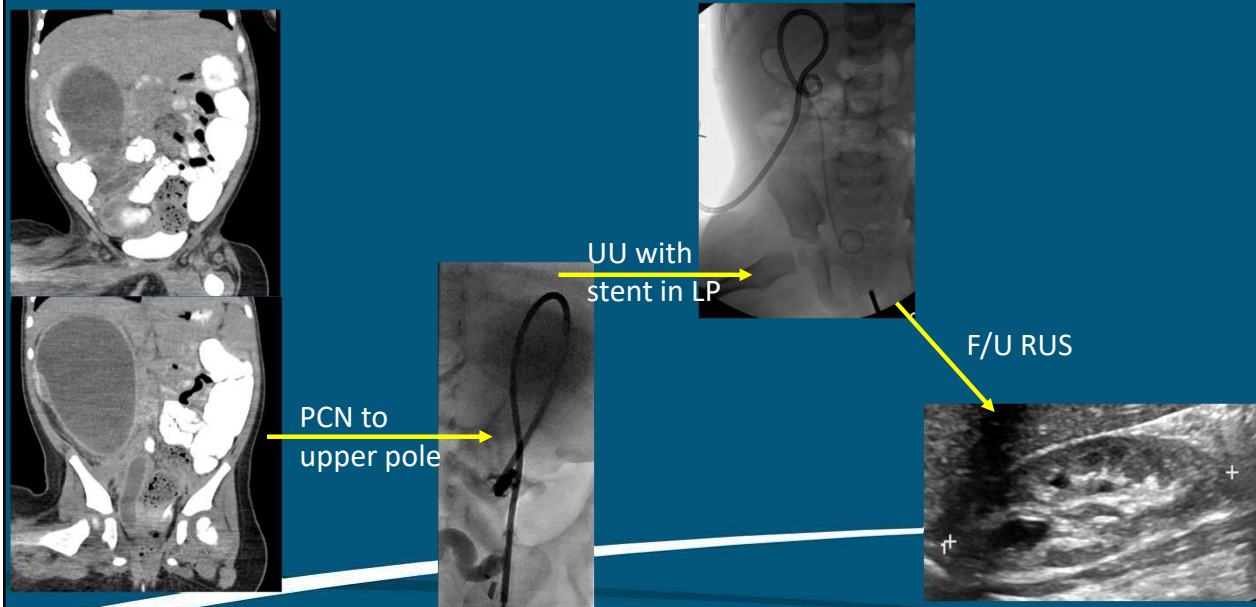

## Ectopic Ureter Management

- *Will usually need surgery*
  - Very dysplastic kidney could be observed
- Uretero-ureterostomy (robotic vs open)
- Upper pole heminephrectomy (if no function)
- Ureteral reimplant
- Cutaneous ureterostomy followed by reimplant (if very large or sepsis)
- Nephrostomy tube followed by uretero-ureterostomy (if sepsis)
- Endoscopic incision **NOT** an option
  - Fistula from bladder to ectopic ureter -> incontinence in females

61

## Ectopic ureter 14 month old with sepsis

62

## CAKUT - Categories

- Renal parenchymal anomalies
  - Renal dysplasia, MCDK, ADPKD, ARPKD, renal agenesis
- Collecting system anomalies
  - Hydronephrosis, UPJ obstruction, megaureter, megacalycosis, ectopic ureter, ureterocele, duplicated kidney, VUR
- Renal ascent and fusion anomalies
  - Ectopic kidney, horseshoe kidney, crossed renal ectopia (fused/unfused)
- Lower urinary tract anomalies
  - Posterior urethral valves, anterior urethral valves, urethral atresia, megalourethra, prune belly syndrome, urachal remnants

American  
Urological  
Association  
Education & Research, Inc.

63

## Renal Ascent and Fusion Anomalies

- Ectopic pelvic kidney
  - Most common ectopic kidney, ~1/1000
  - Increased risk of VUR, UPJ obstruction, lower differential function
  - If no UTIs or hydronephrosis, limited follow up necessary
  - Blood supply is anomalous
  - Renal pelvis often anteriorly rotated
- Other locations rare (Thoracic)

American  
Urological  
Association  
Education & Research, Inc.

64

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Renal Ascent and Fusion Anomalies

- Horseshoe kidney
  - Most common fusion anomaly (~1/600)
  - **Isthmus below the inferior mesenteric artery**
  - Anomalous blood supply -> crossing vessels
  - Increased risk of VUR, UPJ obstruction
  - If no UTIs or hydronephrosis, limited follow up
  - **Medially oriented calyces on VCUG**
- Crossed/fused and crossed/unfused ectopia
  - Less common, similar management

## CAKUT - Categories

- Renal parenchymal anomalies
  - Renal dysplasia, MCDK, ADPKD, ARPKD, renal agenesis
- Collecting system anomalies
  - Hydronephrosis, UPJ obstruction, megaureter, megacalycosis, ectopic ureter, ureterocele, duplicated kidney, VUR
- Renal ascent and fusion anomalies
  - Ectopic kidney, horseshoe kidney, crossed renal ectopia (fused/unfused)
- **Lower urinary tract anomalies**
  - **Posterior urethral valves, anterior urethral valves, urethral atresia, prune belly syndrome, urachal remnants**

## Posterior Urethral Valves

- ~1/5000-8000
- Membranous folds in posterior urethra
- Presentations
  - Prenatal hydronephrosis (most common)
  - UTIs, incontinence, renal failure
- Wide spectrum of severity
  - Anhydramnios with fetal demise to mild symptoms with late presentation
- **An important diagnosis to not miss**

American Urological Association  
Education & Research, Inc.

67

## PUV: prenatal imaging findings

- Hydronephrosis and hydroureter, usually bilateral
- Renal dysplasia
- **Distended bladder**
  - “Keyhole” sign
- Amniotic fluid levels
  - Can be normal to anhydramnios

American Urological Association  
Education & Research, Inc.

68

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## LUTO: Prenatal Intervention

- PUV is most common cause of Lower Urinary Tract Obstruction (LUTO)
- Normal amniotic fluid levels = better postnatal renal function
- Severe oligohydramnios -> Fetal death due to pulmonary hypoplasia
- Fetal urine begins at ~10 weeks, oligohydramnios seen by 16 weeks
- **Goals of prenatal intervention**
  - **Improve lung function by increasing amniotic fluid**
  - **Improve renal function by relieving obstruction**
- Fetal urine should be dilute (concentrated urine = bad outcomes)
  - Urine osmolality >200 mOsm/L, Urine sodium >100 mEq/L; predicts poor outcomes

American  
Urological  
Association  
Education & Research, Inc.

69

## Vesicoamniotic Shunt for LUTO

- 2013 randomized trial (PLUTO trial)
  - Recruited 31 patients (goal 150)
  - **Intention to treat, no difference in survival**
  - **As treated analysis, survival benefit**
    - 2 years 8/16 vs 2/15 ( $p=0.02$ )
  - **No difference in renal outcomes**
- 2016 Meta-analysis of 6 available studies
  - <200 patients
  - **Early survival benefit, but not at 6, 12, 24 mo**
  - **No significant renal benefit, no good predictors**

Fetal bladder catheter

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Vesicoamniotic Shunt for LUTO

- **Possible survival benefit due to improved lung function**
- **Unproven renal benefit**
- Complications common
  - Preterm labor, fetal loss, shunt dislodging, wrong diagnosis
- Fetuses most likely to benefit
  - Oligohydramnios/anhydramnios
  - Severe bilateral hydronephrosis but no cystic dysplasia
  - Favorable urine parameters on amniocentesis (dilute urine)
- Overall, limited outcome data. Controversial.

American  
Urological  
Association  
Education & Research, Inc.

71

## PUV: Management after birth

- Renal US and VCUG
- Drain bladder
- Monitor renal and pulmonary function
- Antibiotic prophylaxis typical

72

© 2025 AMERICAN UROLOGICAL ASSOCIATION. ALL RIGHTS RESERVED.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## PUV: VCUG variable but patterns exist

73

## PUV: VCUG findings

- Dilated posterior urethra
- Narrow segment at membranous urethra
- VUR (up to 75%)
- Bladder trabeculations and elongation
  - Can have smooth bladder

74

© 2025 AMERICAN UROLOGICAL ASSOCIATION. ALL RIGHTS RESERVED.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## PUV: Cystoscopy and Endoscopic Incision

- Endoscopic incision for most infants
  - If too small, can leave catheter and dilate urethra
  - Vesicostomy rarely needed before valve ablation
- Incision at 5, 7, +/- 12 o'clock
- Cut current, cold knife, laser
- Complications: stricture, incomplete resection
- Catheter for 1-3 days
- Circumcision associated with lower UTI risk<sup>1</sup>
  - 3% vs 20% first 2 years, 2022 randomized trial

75

## PUV: Follow Up After Incision

- **Repeat VCUG after resection**
- **Hydronephrosis: monitor**
  - Majority improve/resolve
- VUR: 2/3 will resolve & more improve
  - Rarely surgery necessary
- Toilet training
  - On average delayed about 2 years (age 5-6)
  - Double voiding, timed voiding can be helpful
  - Poor renal function associated with more delay
  - Overnight catheter drainage for select cases

**Table 2.** Spontaneous vesicoureteral reflux resolution on conservative management in group 1

Variable	First Year No (%)	Second Year No (%)	Third Year No (%)	Fourth Year No (%)	Fifth Year No (%)
VUR resolution*					
Grade I	0	10 (33.3)	24 (80.0)	25 (83.3)	25 (83.3)
Grade II	0	2 (8.7)	9 (39.1)	15 (65.2)	18 (78.2)
Grade III	0	0	1 (20.0)	1 (20.0)	2 (40.0)
Grade IV	0	0	0	2 (22.2)	2 (22.2)
Grade V	0	0	0	0	0
VUR improvement*					
Grade I	0	10 (33.3)	24 (80.0)	25 (83.3)	25 (83.3)
Grade II	0	2 (8.7)	9 (39.1)	15 (65.2)	18 (78.2)
Grade III	0	0	1 (20.0)	3 (60.0)	4 (80.0)
Grade IV	0	0	1 (11.1)	2 (22.2)	4 (44.4)
Grade V	0	0	0	1 (25.0)	1 (25)

**Figure 1.** Comparison of daytime incontinence between patients with PUVs and controls.

76

## PUV: Urodynamic patterns

- **Classic teachings**

1. Infants/toddlers: high pressure, detrusor overactivity
2. Children: improved compliance, detrusor overactivity
3. Older children: large capacity, myogenic failure
  - “end stage valve bladder”. Higher risk with worse CKD and high UOP. **Possible overnight drainage.**

- **Most will toilet train, but delayed on average**

- **Timed voiding, double voiding common**

- Routine UDS,  $\alpha$ -blockers, anticholinergics of unclear utility.

- **Follow clinically, check renal UA, UA, labs, PVRs annually**

American  
Urological  
Association  
Education & Research, Inc.

77

## PUV: Long term outcomes

- Vesicostomy or cutaneous ureterostomy
  - Unclear indications/benefit. Some are more aggressive with diversion.
- **20-50% will have ESRD in lifetime -> nephrology f/u**
- < 20% will have incontinence in adulthood
- Paternity possible, less likely if ESRD
- Possible CIC or overnight drainage for myogenic failure/high UOP
  - APV can facilitate CIC for rare case that needs it (sensate urethra).
- Primary urology involvement: do a good valve ablation, circumcision (or resolve phimosis) can lower UTI risk, manage voiding expectations

American  
Urological  
Association  
Education & Research, Inc.

78

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Anterior Urethral Valves and Urethral Atresia

- Very rare causes of LUTO in males
- Severe bilateral hydronephrosis and distended bladder
- Anterior Valves
  - VCUG: obstructing ventral web +/- diverticulum
  - Endoscopic incision, +/- urethral reconstruction
- Urethral atresia
  - If no patent urachus, then survival unlikely
  - If patent urachus, then vesicostomy followed by urethral reconstruction/diversion

American  
Urological  
Association  
Education & Research, Inc.

79

## Megalourethra

- Rare congenital anomaly
- Scaphoid:
  - Deficiency of corpus spongiosum
- Fusiform
  - Deficiency of corpus cavernosum & spongiosum, ? abnormal glans
  - Upper tract anomalies
- Prune belly syndrome, VACTERL
- Scaphoid variant easier to reconstruct and function

American  
Urological  
Association  
Education & Research, Inc.

ATTENTION: You are prohibited from using or uploading content you accessed through this activity into external applications, bots, software, or websites, including those using artificial intelligence technologies and infrastructure, including deep learning, machine learning and large language models and generative AI.

## Prune Belly Syndrome/Eagle Barret Syndrome

- 3-4 in 100,000 births; >95% males
- **Constellation of findings (classic triad)**
  - **Abdominal wall laxity**
  - **Urinary tract dilation: more severe distally**
  - **Bilateral intra-abdominal UDT**
- Associated finding
  - Renal dysplasia
  - Chronic lung disease
  - Prostate hypoplasia
- Can be misdiagnosed with PUV prenatally

American  
Urological  
Association  
Education & Research, Inc.

81

## Prune Belly Syndrome Management

- Prevent UTIs
  - Circumcision vs steroid cream for phimosis
  - Antibiotic prophylaxis
  - Avoid unnecessary catheterization
- Bilateral orchiopexy
- +/- abdominal wall reconstruction
  - Cosmetic, ? improve bladder emptying & pulmonary function
- +/- urinary tract reconstruction
  - Individualized management, most do not need reconstruction
- Voiding – timed voiding/double voiding
- CKD management – long term follow up with nephrology/urology

American  
Urological  
Association  
Education & Research, Inc.

## Urachal Remnants

- Connection between bladder and allantois
  - Median umbilical ligament
- Types: Patent urachus, urachal cyst, urachal diverticulum, urachal sinus
- Historically: malignancy concern -> surgery
  - >5000 surgeries to prevent 1 cancer<sup>1</sup>
- Incidental -> non-operative/observational<sup>2</sup>
- Patent urachus, infected cyst -> excision<sup>2</sup>
- Patent urachus -> obstruction?

American  
Urological  
Association
